

59-187395

[Claim 1] A storage type active panel comprising an electric circuit formed on a semiconductor substrate, and having a control circuit to control liquid crystal driving signals with a storage circuit storing image data for each pixel in said pixel and data of said storage circuit,

wherein said storage circuit for image data of each pixel comprises register circuits for one bit of consecutive shift registers arranged vertically or horizontally on a screen, and an image data is transmitted to register circuits in a vertically or horizontally adjacent pixel according to a clock signal input in each register circuit.
